Recursive Wordle Solver
A reproducible R tutorial

Introduction

`setwd()` vs. R Projects

- `setwd()` usually uses a hard-coded directory specific to the user's machine
- R projects are directory-agnostic and can store workspace images
- Can set up git with an R project for integrated version control

`contents.R`

- Main script is `contents.R`
- Used to call all other scripts in order
- Easy to see what's going on at a high level
- Clearing memory is optional, but helpful to avoid accidentally writing code that depends on variables that aren't produced inside the project

Loading libraries

- `config/libraries.R` checks for required packages and installs any missing ones

- It is useful to document which packages are used in which scripts, so that any redundant packages can be cleared out before making the code available to others

- Packages like `renv` can be used in situations where reproducibility is critical

- `renv` is similar to python's virtual environments `venv`, where dependencies are rolled up into a self-contained unit separate from the user's specific installation of R

- This means the code is less likely to break if run on different machines with different versions of R and R packages

- Note: `renv` uses static code analysis, so will not work with custom package loading like the one used in `libraries.R`; use `library('packageName')` instead

Reading data

- The `data/` folder contains any data files used in the project

- This could be raw data which is then transparently cleaned in R, or, in cases where this is not appropriate or feasible, data that has been cleaned in a separate program/script (e.g., Fieldtrip)

- `src/` is the source code folder where most of your scripts will live

- The first script called after `config/libraries.R` is usually `/src/read_data.R` to read all your raw data files into R

- Depending on how much reformatting and cleaning is required, you may include a separate script (or even folder of scripts) dedicated to this, or just do it all in `read_data.R` if there is only a trivial amount

Libraries

- `tidyverse` is a collection of packages which greatly improve upon the basic functionality of R and are usually worth loading at the start of every new project

- `magrittr` is a `tidyverse` package, but is not loaded by default when `library('tidyverse')` is called; it contains the very useful `%<>%` assignment pipe operator
